

Section 6 1.2C

Yearly soil testing using the Haney Soil Test within 5', 10', & 20' or an appropriate distance out around city and township well heads that will test for soil contamination that would seriously contaminate the soil & water used by humans and other species so remediation can be initiated. Soil contamination is dangerous to our food sources as well.

It is highly recommended that private landowners should test their wells and surface water areas using the Haney soil test so remediation can be initiated as needed too.

Respectfully,

Becky Grey
Carbon County Resource Council
